

Project Design Phase
Proposed Solution Template

Date	13 July 2026
Team ID	SWTID-2026-9658
Project Name	Customer Registry
Maximum Marks	2 Marks

Proposed Solution :

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Customers face a frustrating "black box" support system where technical complaints get lost in disconnected channels, lacking real-time tracking, status transparency, or database validation.
2.	Idea / Solution description	A responsive, single-page web application built on the MERN Stack (MongoDB, Express, React, Node.js) featuring secure registration, automated ticket creation, real-time status updates, and a dynamic dashboard for both users and support agents.
3.	Novelty / Uniqueness	The application utilizes an optimized, single-page reactive interface that provides instant status filtering and milestone-based visual tracking, eliminating complex multi-step form friction and reducing database lag.
4.	Social Impact / Customer Satisfaction	It dramatically reduces customer anxiety and frustration by providing absolute transparency over ticket handling, building trust between consumers and brands, and ensuring no complaint is forgotten.
5.	Business Model (Revenue Model)	Offered as a B2B SaaS (Software as a Service) platform with a tiered subscription model: a free tier for small businesses with basic ticket volumes, and paid premium tiers offering advanced analytics, automated routing, and priority support.
6.	Scalability of the Solution	Powered by MongoDB's flexible, non-relational document schema and a modular Express/Node.js backend, the platform is designed to effortlessly scale horizontally to handle millions of customer complaints and concurrent user connections.
